

SUPPLYING SUPERIOR MACHINE TOOL SOLUTIONS

It is very rare that I see something that is a **complete industry game changer!** This is one of them. We may look back **in 5 years time** to see how the roofing industry falls into two neat groups...those who caught hold of the new SIN beam idea and dominate their rivals and those who were too busy to consider it!

The main advantages are....

- the SIN beam is 1/3 lighter than traditional H beam
- the SIN beam is **far stronger** because of the corrugated web allowing much **great spans** and in many cases the **removal or reduction of columns.**
- You can produce various width and lengths without producing scrap.
- No imported and shipping costs and delivery can be JIT.
- **No special skills** are required to run the fully automatic welding machine that is run by one operator.
- Specialist Machinery Sales can supply the machine to automatically manufacture the SIN Beam at 1m/min

We are one of the few locations where these machines can be sold because in Europe the machine manufacturer is also a wholesaler of the beams!

The company also manufacture roofing roll forming machines that produce roofing products.

I am more than pleased to introducing your business to this **revolution in manufacturing** that your own corrugated SIN beams will represent.

So in summary you will offer to the market a stronger, longer spanning beam with less waste! This new technology would allow your business to enter the structural market with a **huge point of difference** and would allow you to be ...

- Competitive and profitable against the local or imported structural packages that are imported from China.
- Achieve higher margins.
- Deliver huge Engineering advantages
- Have a unique product that will greatly disadvantage your competitor

Video is loaded on the Specialist Machinery Sales website that demonstrates the above
